

Install Plentake on Windows

About a minute. Works with Adobe Premiere Pro 2020 or newer.

1 Unzip the download — keep the files together

Right-click **Plentake-Win.zip** > Extract All. Keep the extracted files in one folder.

2 Quit Premiere Pro, then double-click Install-Plentake-Win.bat

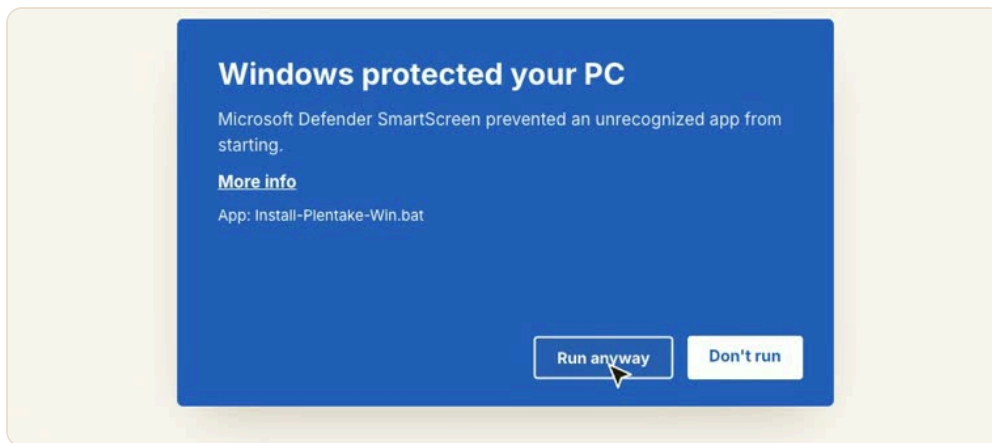

It unpacks the panel into your own AppData folder. You can open it in Notepad first to read it.

3

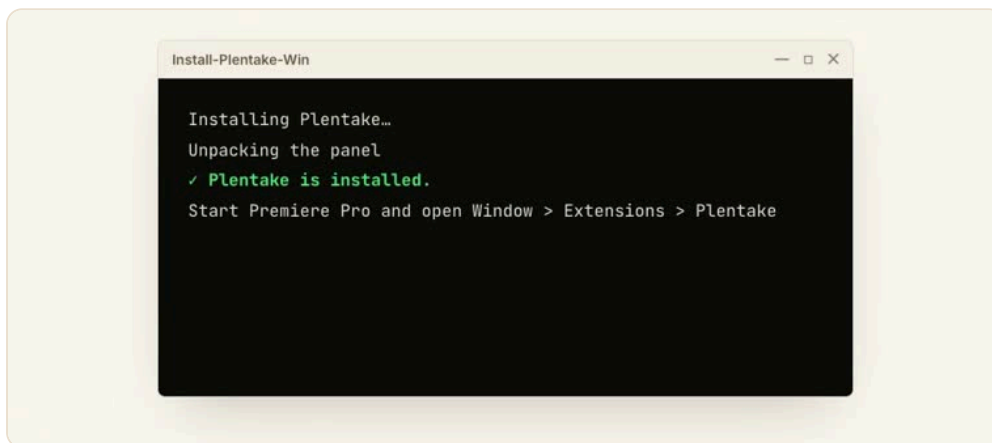

"Windows protected your PC"? Click More info > Run anyway

Windows shows this for files downloaded from the internet. It appears only once.

4

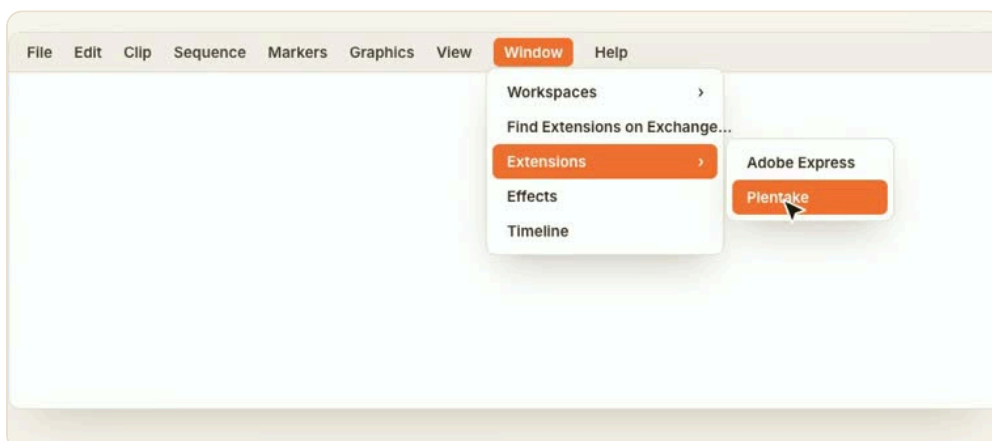

When it says it's done, open Premiere Pro

5

Window > Extensions > Plentake

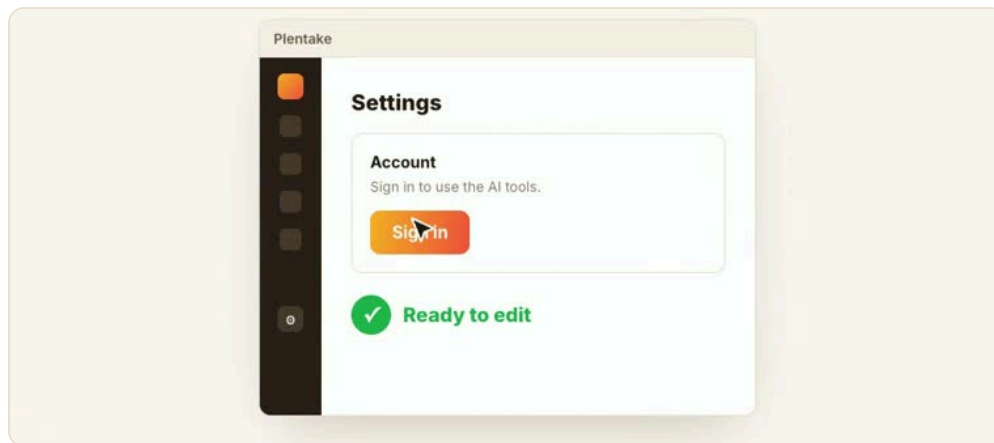

The panel opens as a normal Premiere Pro window you can dock anywhere.

6

Sign in from the Settings tab

Every AI tool runs through your Plentake account — you never enter an API key.

Updating later: download the new version and run its **Install-Plentake-Win.bat** — it replaces the old version automatically. Your settings are kept.
